25

- 1. (Withdrawn) A semiconductor device, comprising:
 - a semiconductor substrate;
 - an isolation film buried in the substrate;
 - a gate insulating film formed between the isolation film and having end portions adjacent to the isolation film that are thicker than a central portion.
- 2. (Withdrawn) The semiconductor device according to claim 1, further including:
 a trench in the semiconductor substrate between adjacent gate insulating films and having a width essentially the same as the distance between the adjacent insulating films; and
 the isolation film is buried in the trench.
- 3. (Withdrawn) The semiconductor device according to claim 1, further including:
 a first electrode formed on the gate insulating film;
 a capacitance insulating film formed on the first electrode; and
 a second electrode formed on the capacitance insulating film.
- 4. (Withdrawn) The semiconductor device according to claim 1, wherein:
 an upper surface of the isolation film is at substantially the same
 height as an upper surface of the end portion of the gate insulating film.
 - 5. (Withdrawn) The semiconductor device according to claim 1, wherein:

 an upper surface of the isolation film is higher than an upper surface of the end portion of the gate insulating film.
 - 6. (Withdrawn) The semiconductor device according to claim 1, further including:

 a first electrode formed on the gate insulating film and having a recessed portion at a central first electrode portion between the isolation film.

- 7. (Withdrawn) The semiconductor device according to claim 1, wherein: the semiconductor device is a flash memory.
- 8. (Previously Amended) A manufacturing method of a semiconductor device, comprising the steps of:

forming a first oxide film on a surface of a semiconductor substrate;

depositing a stacked film including a first conductive layer in contact with the first oxide film;

etching the stacked film and the first oxide film to form a plurality of stacked film patterns arranged on the semiconductor substrate;

oxidizing the semiconductor substrate to form a second oxide film on a surface of the semiconductor substrate sandwiched between adjacent said stacked film patterns and a surface of the semiconductor substrate below end portions of the stacked film patterns wherein the second oxide film has a film thickness thicker than the first oxide film;

forming a side wall mask film on a side of the stacked film patterns to form mask patterns including the stacked film patterns;

removing the portion of the second oxide film sandwiched between the mask patterns and a portion of the underlying semiconductor substrate using the mask patterns as a mask to form a trench in the semiconductor substrate; and

filling the trench with an insulating film

wherein the stacked film includes a stopper film that provides a stopper for a chemical mechanical polishing step.

9. (Original) The manufacturing method of a semiconductor device according to claim 8, wherein:

the step of filling the trench with an insulating film includes forming the insulating film to have a top surface having a height that essentially matches with a height of the second oxide film.

10. (Original) The manufacturing method of a semiconductor device according to claim 8, further including the steps of:

forming a capacitance insulating film on the surface including the first conductive layer after the step of filling the trench with an insulating film; and

forming an electrode on the capacitance insulating film.

11. (Original) The manufacturing method of a semiconductor device according to claim 8, wherein:

the side wall mask film includes a nitride film.

25

10 **12.** (Original) The manufacturing method of a semiconductor device according to claim 8, wherein:

the second oxide film is approximately 20 to 50 nm thicker than the first oxide film.

13. (Cancelled) The manufacturing method of a semiconductor device according to claim 8, wherein:

the stacked film includes a stopper film that provides a stopper for a chemical mechanical polishing step.

20 **14**. (Cancelled) A manufacturing method of a semiconductor device, comprising the steps of:

forming a first oxide film on a surface of a semiconductor substrate;

depositing a stacked film different from the first oxide film and including a first layer on the first oxide film;

etching the stacked film and the first oxide film to form a plurality of stacked film patterns arranged on the semiconductor substrate;

oxidizing the semiconductor substrate to form a second oxide film on a surface of the semiconductor substrate sandwiched between adjacent

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

stacked film patterns and a surface of the semiconductor substrate below end portions of the stacked film patterns wherein the second oxide film has a film thickness thicker than the first oxide film;

removing the portion of the second oxide film sandwiched between the stacked film patterns and a portion of the underlying semiconductor substrate using the stacked film patterns as a mask to form a trench in the semiconductor substrate; and

filling the trench with an insulating film.

15. (Currently Amended) The manufacturing method of a semiconductor device according to claim 14, wherein A manufacturing method of a semiconductor device, comprising the steps of:

forming a first oxide film on a surface of a semiconductor substrate;

depositing a stacked film different from the first oxide film and including a first layer on the first oxide film;

etching the stacked film and the first oxide film to form a plurality of stacked film patterns arranged on the semiconductor substrate;

oxidizing the semiconductor substrate to form a second oxide film on a surface of the semiconductor substrate sandwiched between adjacent stacked film patterns and a surface of the semiconductor substrate below end portions of the stacked film patterns wherein the second oxide film has a film thickness thicker than the first oxide film;

removing the portion of the second oxide film sandwiched between the stacked film patterns and a portion of the underlying semiconductor substrate using the stacked film patterns as a mask to form a trench in the semiconductor substrate; and

filling the trench with an insulating film

wherein the step of filling the trench with an insulating film includes forming the insulating film to have a top surface coplanar with the top surface of the first layer.

depositing a stacked film different from the first oxide film and including a first layer on the first oxide film;

etching the stacked film and the first oxide film to form a plurality of stacked film patterns arranged on the semiconductor substrate;

oxidizing the semiconductor substrate to form a second oxide film on a surface of the semiconductor substrate sandwiched between adjacent stacked film patterns and a surface of the semiconductor substrate below end portions of the stacked film patterns wherein the second oxide film has a film thickness thicker than the first oxide film;

removing the portion of the second oxide film sandwiched between the stacked film patterns and a portion of the underlying semiconductor substrate using the stacked film patterns as a mask to form a trench in the semiconductor substrate;

filling the trench with an insulating film;

removing the stacked film patterns so that at least the second oxide film below the stacked film patterns remain;

subsequently forming a gate oxide film in a region between portions of the second oxide film; and

forming a first electrode over the gate oxide film and at least a portion of the second oxide film.

- 17. (Original) The manufacturing method of a semiconductor device according to claim 16, wherein:
- the first electrode includes end portions next to the insulating film that are higher than a central portion of the first electrode.

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

18. (Previously Amended) The manufacturing method of a semiconductor device according to claim 16, wherein:

the insulating film has a top surface even with a top surface of the first electrode.

19. (Original) The manufacturing method of a semiconductor device according to claim 16, further including the steps of:

forming a capacitance insulating film on the first electrode; and forming a second electrode on the capacitance insulating film.

20. (Original) The manufacturing method of a semiconductor device according to claim 16, wherein:

the first electrode includes polysilicon.

21. (Previously Added) The manufacturing method of a semiconductor device according to claim 8, wherein:

the first conductive layer of the stacked film is a transistor gate electrode layer.
